

Where the ball actually went: the same depth control video in all nine clips, seed 42

“The ball starts at the far left, travels quickly from left to right across the entire frame, lands near the far right, and continues rolling to the right.”

“The ball flies in an arc through the air and then bounces on the grass.”

“The ball drops nearly straight down near the centre of the frame and bounces in place with almost no sideways motion.”

— the control video's own ball • frame 0 of the clip • frame 80

Each box is one 848 × 480 frame as the camera sees it: x runs left to right, y runs top to bottom. Grey ribbon: the ball in the depth control video (control_fixed.mp4), in frame for 63 of its 81 frames. Every clip used that one control video. Each dot is one frame, drawn at the size of the blob the tracker locked onto. The number in each box is that clip's sideways travel — the tracked x range, in frame widths. The ball was tracked in 80 or 81 of the 81 frames in every box.

All three prompts open with one shared sentence and close with the sentence beside their row. The shared opening: “A photorealistic video of a yellow rubber ball over a green grassy field on a clear sunny day, fixed camera, natural shadows.”

Red: the sentence that asks for the opposite of the control video, in which the ball travels from left to right.
