

Prompt and its claims

Name the things once

a single pass over the whole prompt lists every distinct object or actor it mentions, and every separate occurrence of an event, and fixes a name for each; nothing is measured in this pass

Claims taken in small groups

a few claims at a time, in the order they appear in the prompt

For each group: what would settle these claims

the group is shown the whole prompt and the whole list of names, but only its own claims; it may refer to any name on the list, and may not invent a new one

Names made group-local

each group's measurements and checks are renumbered under that group's own label and its internal references rewritten to match, so two groups cannot collide; claims keep the wording they were given

Groups assembled into one plan

The whole plan is checked, not each group

types, argument shapes and every cross-reference are checked over the assembled plan; each complaint is traced back to the group it came from

a group failed

Re-ask that group

shown its own complaints and the rules of the format — never what to conclude

still failing

Otherwise, fall back claim by claim

a group that still fails hands its claims one at a time to the general verifier; each is charged, none is dropped

the plan stands

Execution

a measurement requested more than once is executed once, and fixed rules turn the evidence into the per-claim outcomes and the clip answer
